RESEARCH AND
PUBLICATION ETHICS

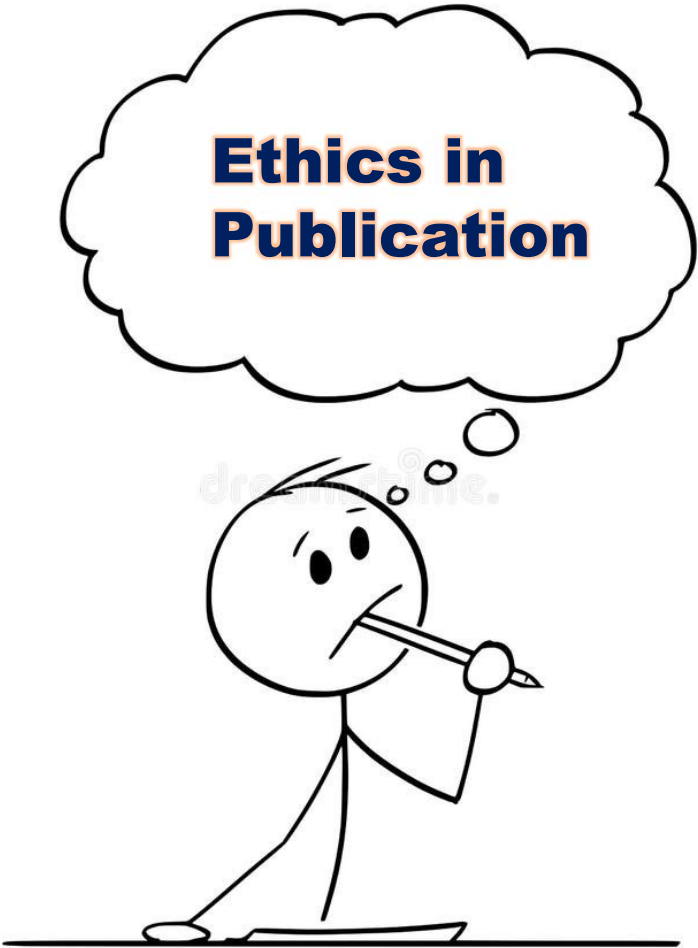

ETHICS ??

“Ethos” *means* “character”

Rules that deal with

- what is right or wrong,
- good practice or bad,
- moral or immoral, etc.

Ethics in Publication

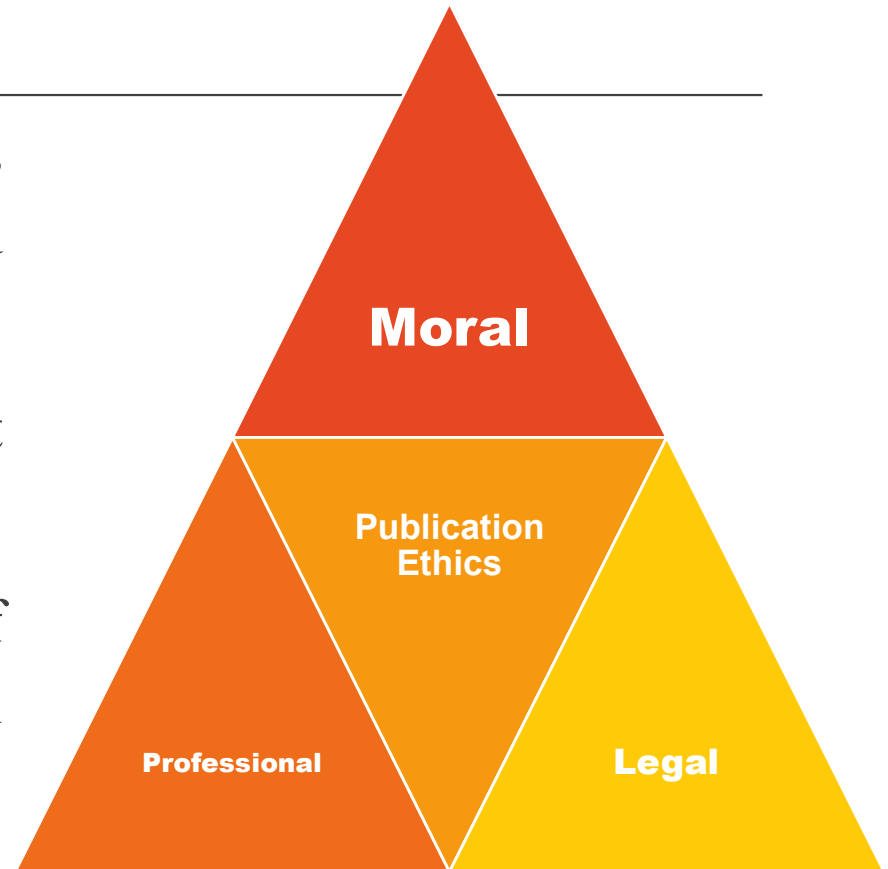

Standards and guidelines that ensure the quality and integrity

Promote *accountability, transparency,* and *honesty*

But when the researchers violates the ethical requirements misconduct occur.

Perspectives of publication ethics

- ***Moral perspective*** to publication ethics refer to publishing false or fabricated data
- ***Professional perspective*** refers to not giving due credit to contributing authors
- ***Legal perspective*** involves violation of copyrights or other intellectual properties

PUBLICATION MISCONDUCTS

Data fabrication

- *Data Fabrication* is making up data or results.
- Constructing data that never occurred during the experimentation, or the experiments might not have been conducted only.
- Claims made in the paper on the incomplete data set or the ideally assumed results.

Data falsification

- Manipulating research materials, equipment, or processes,
- Changing or omitting data or results
- *The manipulation of data giving a false impression of the study.*

Plagiarism

- Plagiarism is one of the *most dangerous misconducts* in research .
- *“Plagiarism is the appropriation of another person’s ideas processes, results or words without giving appropriate credit.”*

DIRECT

A portion of someone's writing is copied word by word

SELF

Researcher presents their own published ideas

ACCIDENTAL

Researchers doesn't cite their sources or misquotes without giving proper attribution

Dual submissions

- Submitting the same articles to multiple journals at the same time.
- Wastes the time and efforts of multiple reviewers of different journals
- May contain the same contents in different languages

Improper author contribution or Inappropriate authorship

- Including the author who has not contributed
- Excluding those who contributed to the research work
- *People who have contributed* toward the work and the manuscript preparation but *do not qualify as co-authors* may be included in the acknowledgment section.

IMPROPER AUTHORSHIP

GIFT

GHOST

WHAT IS **GIFT** AUTHORSHIP?

- The main author or first author creates the idea, plans, carry outs the work and writes the paper.
- Gift authors are the ones which are included as co-authors but not have significantly or not at all contributed.
- Sometimes these may be your senior colleagues, supervisors or heads of the departments.

WHAT IS **GHOST** AUTHORSHIP?

- Ghost author means *the person who participated* in the study, analysis, experimentation, and even publication draft writing but is *not named on the author list*.
- This occurs especially in case *the ghost author is your junior colleague* who contributed in all aspects until publication but is neither listed in the author list nor in the acknowledgement.

Redundant Publication

- It is the publication of a paper which is similar to a published paper by the same author .
- He does this without acknowledging the source.
- It is turned to be a wastage to the editor and reviewer in every way.

Salami slicing

- Sometimes the researcher wants to enhance their publication number.
- As a result they divide the data set. It would have been a meaningful paper with the whole data but due to splitting different papers have been formed.
- It affects the importance of the data. This is called the salami publication or salami slicing.

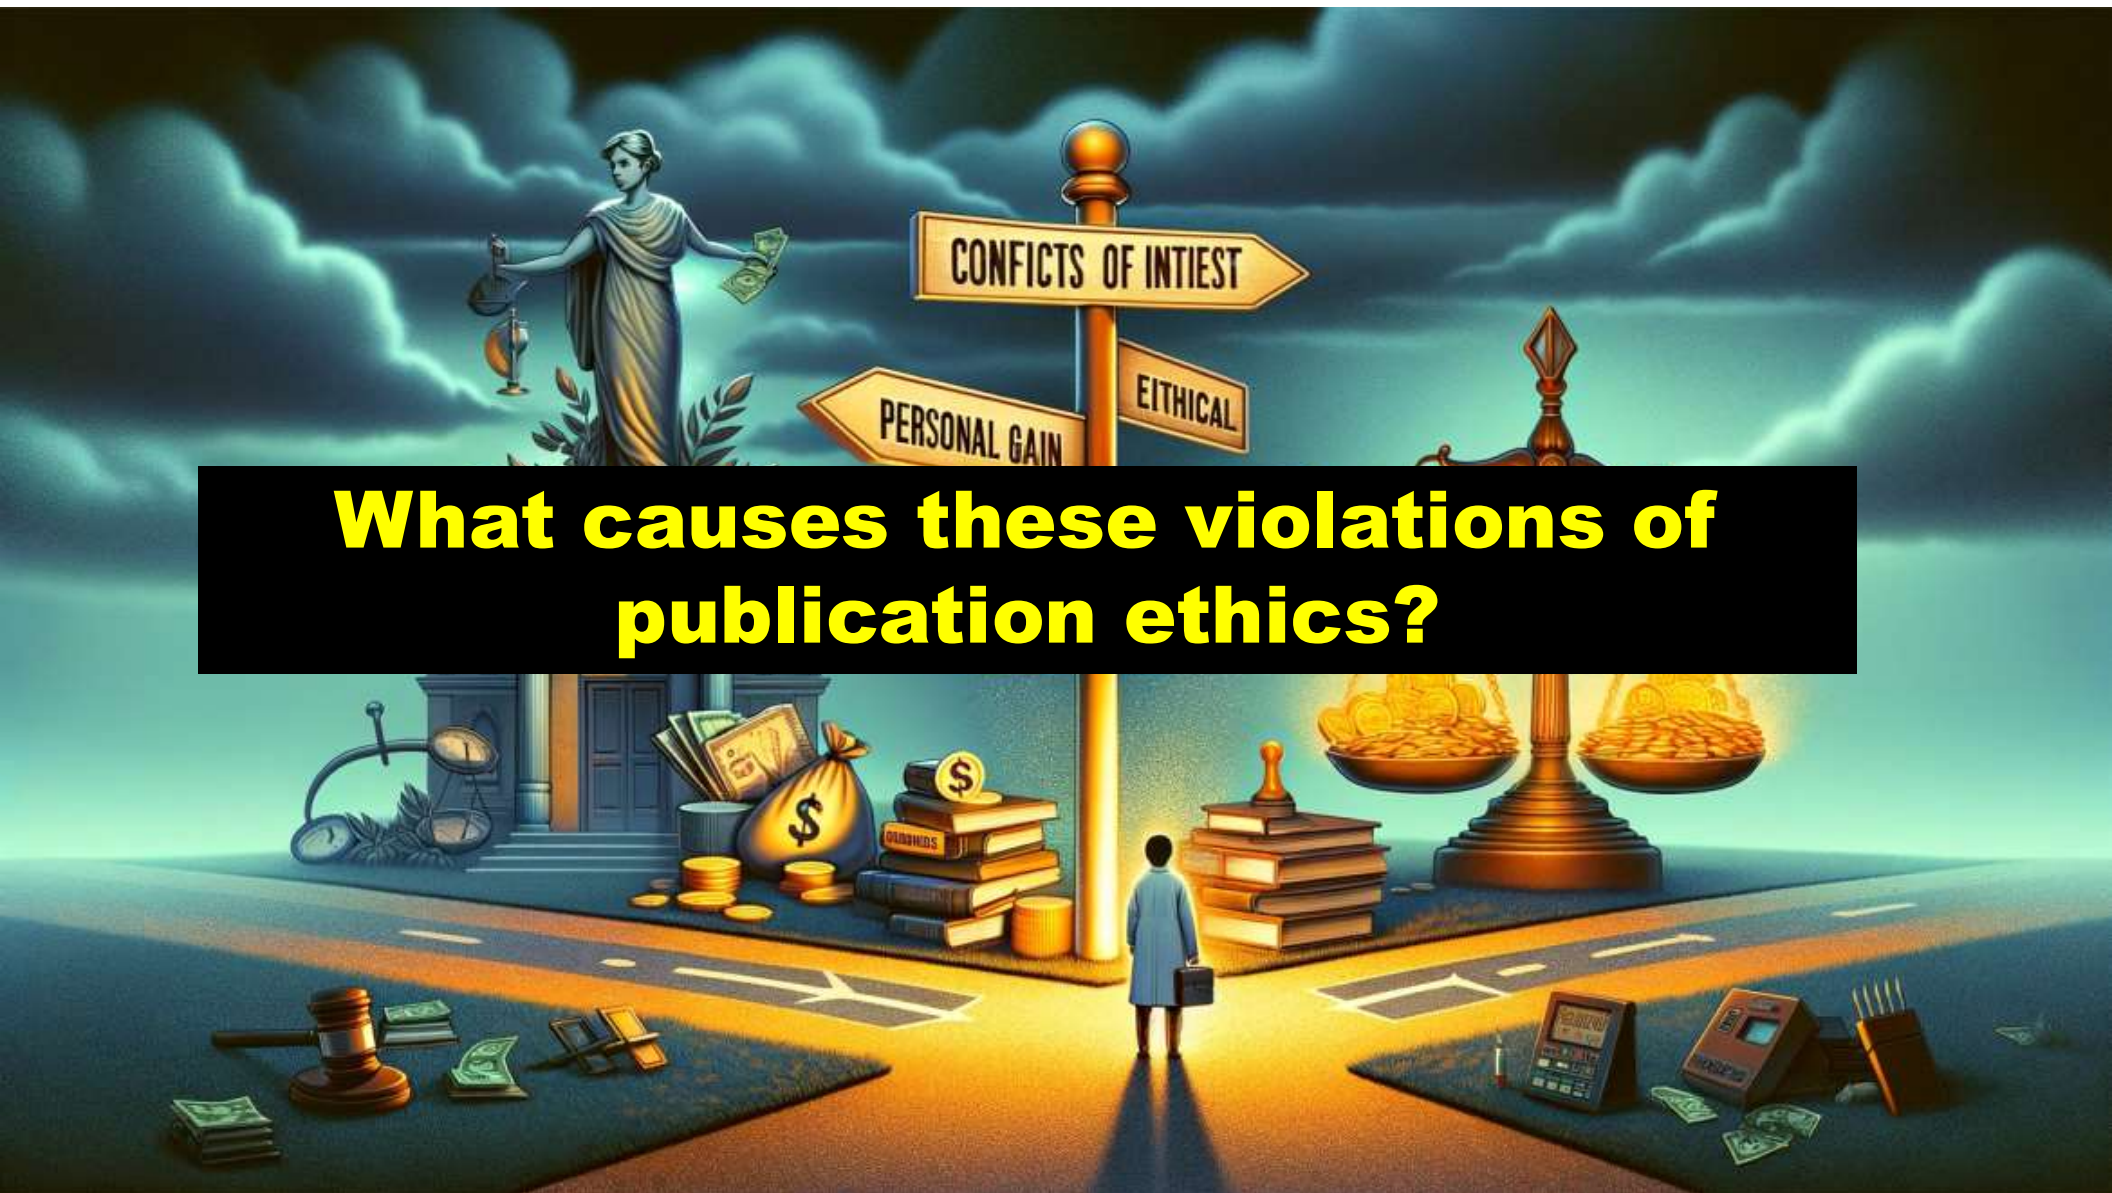

Conflict of interest

- When authors have a financial or personal interest that consequently influences his/her actions, judgments, and content being published.
- In such cases, these interests affect the opinions or conclusions drawn from the study.
- Hence such conflict of interest must be revealed to the editor or publisher while submitting the manuscript.

Citation manipulation

- The main purpose is to increase the number of citations to the given author's work.
- The author should also refrain from excessively citing their previous work or their friends, colleagues, or institution's publications if they have not read.
- Researchers must also avoid copying the references from other publications if they have not gone through the cited work.

What causes these violations of publication ethics?

What causes these violations of publication ethics?

- Bigger is the publication list better is the CV but lacks merit, skills, knowledge.
- So this race of increasing the count of publication and frequent or continuous publications many times lead to unethical publication practices

Reasons of Publication Misconduct

- Lack of awareness about research and publication ethics
- Pressure for publication
- Wish for massive curriculum vitae
- Academic advancement and promotion
- Competition among the colleagues
- Professional supremacy

Consequences of Publication Misconduct

- It could mean the end to career as a researcher. He may be dismissed and rejected.
- Academic achievement may be taken away.
- It means a huge loss of fund, time, reputation to the editor and reviewer as well as the researcher.
- Destroy the public trust on researchers because people in general have lot of faith on the researchers.

Conclusions

- Publication of research work is very much important.
- The published work helps the young researchers to enrich their knowledge.
- They gather information from that .
- But there is research ethics .
- All researchers must be aware of that standard procedure to avoid publication misconduct.
