

Network Attack Detection and Its Safety measures

The workshop will provide detail information about the different methods of network and computer attack in detail and also help to predict the attacks occurred based on user queries.

Database creation (API) (mongodb/postman)

Machine learning based threat identification system

Prediction and safety report/measures generation methods from attack

Feedback utilisation method to update and create databases

Machine learning procedure

Step 1 Creation of data and database

Step 2 Creating suitable model to learn from data

Step 3 User query based filtering system (search from data created)

Step 4 output (attack occurred and its precautions/safety measures)

Technological tools/utilities

Virtual Machines at single system (Kali,ubuntu,windows)

Kali penetrative testing and demonstrative method to create attack on windows and ubuntu system

Executable files in different operating system
